

Git Commit Guide for WeMentor Backend

Refined Initial Commit Message

If you are committing the current state of your project, use this detailed message:

```
feat: initialize core backend architecture and infrastructure

- Set up DDD-inspired project structure (cmd, internal, pkg)
- Implement environment-based configuration loader using godotenv
- Integrate structured logging using Uber-Zap
- Configure PostgreSQL connection pooling via pgxpool (Supabase ready)
- Add standardized API response helpers in pkg/response
- Initialize sqlc configuration for type-safe database operations
```

Reusable Commit Template

Copy this into a file named `.gitmessage` in your root directory to use it as a template:

```
<type>(<scope>): <subject>

# <body>
# - Bullet points for specific changes
# - Explain 'why' rather than 'how'

# <footer>
# Fixes #issue_number
```

Type Definitions

For this project, use these prefixes:

- **feat:** A new feature (e.g., adding the user registration endpoint)
- **fix:** A bug fix
- **chore:** Maintenance tasks (e.g., updating dependencies or `Makefile`)
- **refactor:** Code changes that neither fix a bug nor add a feature
- **docs:** Documentation only changes
- **db:** Changes related to migrations or `sqlc` queries

Best Practice Tip

When committing your `pkg/response/response.go` changes, a specific commit might look like: `feat(pkg): add standardized JSON response structure`
